

Assignment 5: Data Visualization

Janice Ye

Spring 2024

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on Data Visualization

Directions

1. Rename this file `<FirstLast>_A05_DataVisualization.Rmd` (replacing `<FirstLast>` with your first and last name).
 2. Change “Student Name” on line 3 (above) with your name.
 3. Work through the steps, **creating code and output** that fulfill each instruction.
 4. Be sure your code is tidy; use line breaks to ensure your code fits in the knitted output.
 5. Be sure to **answer the questions** in this assignment document.
 6. When you have completed the assignment, **Knit** the text and code into a single PDF file.
-

Set up your session

1. Set up your session. Load the tidyverse, lubridate, here & cowplot packages, and verify your home directory. Read in the NTL-LTER processed data files for nutrients and chemistry/physics for Peter and Paul Lakes (use the tidy `NTL-LTER_Lake_Chemistry_Nutrients_PeterPaul_Processed.csv` version in the `Processed_KEY` folder) and the processed data file for the Niwot Ridge litter dataset (use the `NEON_NIWOLitter_mass_trap_Processed.csv` version, again from the `Processed_KEY` folder).
2. Make sure R is reading dates as date format; if not change the format to date.

```
#1
#load packages
library(tidyverse)

## -- Attaching core tidyverse packages ----- tidyverse 2.0.0 --
## v dplyr      1.1.4      v readr      2.1.4
## v forcats    1.0.0      v stringr   1.5.0
## v ggplot2    3.4.4      v tibble    3.2.1
## v lubridate  1.9.3      v tidyr     1.3.0
## v purrr      1.0.2
## -- Conflicts ----- tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()     masks stats::lag()
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors

library(lubridate)
library(here)

## here() starts at /home/guest/EDA_Spring2024
```

```
library(cowplot)

##
## Attaching package: 'cowplot'
##
## The following object is masked from 'package:lubridate':
##
##     stamp
#verify directory
getwd()

## [1] "/home/guest/EDA_Spring2024"

#read files
NTL <- read.csv("./Data/Processed_KEY/NTL-LTER_Lake_Chemistry_Nutrients_PeterPaul_Processed.csv",
                stringsAsFactors = TRUE)
NIWO <- read.csv("./Data/Processed_KEY/NEON_NIWO_Litter_mass_trap_Processed.csv",
                 stringsAsFactors = TRUE)

#2
NTL$sampldate <- as.Date(NTL$sampldate)
NIWO$collectDate <- as.Date(NIWO$collectDate)
```

Define your theme

3. Build a theme and set it as your default theme. Customize the look of at least two of the following:

- Plot background
- Plot title
- Axis labels
- Axis ticks/gridlines
- Legend

```
#3
theme <- theme_light() +
  theme(
    axis.text = element_text(color = "black"),
    legend.position = "top"
  )
```

Create graphs

For numbers 4-7, create ggplot graphs and adjust aesthetics to follow best practices for data visualization. Ensure your theme, color palettes, axes, and additional aesthetics are edited accordingly.

4. [NTL-LTER] Plot total phosphorus (tp_ug) by phosphate (po4), with separate aesthetics for Peter and Paul lakes. Add line(s) of best fit using the lm method. Adjust your axes to hide extreme values (hint: change the limits using xlim() and/or ylim()).

```
#4
tp_ugplot <-
  ggplot(NTL, aes(x = po4, y = tp_ug, color = lakename)) +
  geom_point() +
  geom_smooth(method = lm) +
  xlim(0, 45) +
  ylim(0, 150) +
```

```

theme

print(tp_ugplot)

## `geom_smooth()` using formula = 'y ~ x'
## Warning: Removed 21948 rows containing non-finite values (`stat_smooth()`).
## Warning: Removed 21948 rows containing missing values (`geom_point()`).

```

5. [NTL-LTER] Make three separate boxplots of (a) temperature, (b) TP, and (c) TN, with month as the x axis and lake as a color aesthetic. Then, create a cowplot that combines the three graphs. Make sure that only one legend is present and that graph axes are aligned.

Tips: * Recall the discussion on factors in the lab section as it may be helpful here. * Setting an axis title in your theme to `element_blank()` removes the axis title (useful when multiple, aligned plots use the same axis values) * Setting a legend's position to "none" will remove the legend from a plot. * Individual plots can have different sizes when combined using `cowplot`.

```

#5
aplot <-
  ggplot(NTL, aes(x = month, y = temperature_C, color = lakename)) +
  geom_boxplot() +
  theme(axis.title.x = element_blank(),
        legend.position = "top")

bplot <-
  ggplot(NTL, aes(x = month, y = tp_ug, color = lakename)) +

```

```

geom_boxplot() +
  theme(axis.title.x = element_blank(),
        legend.position = "none")

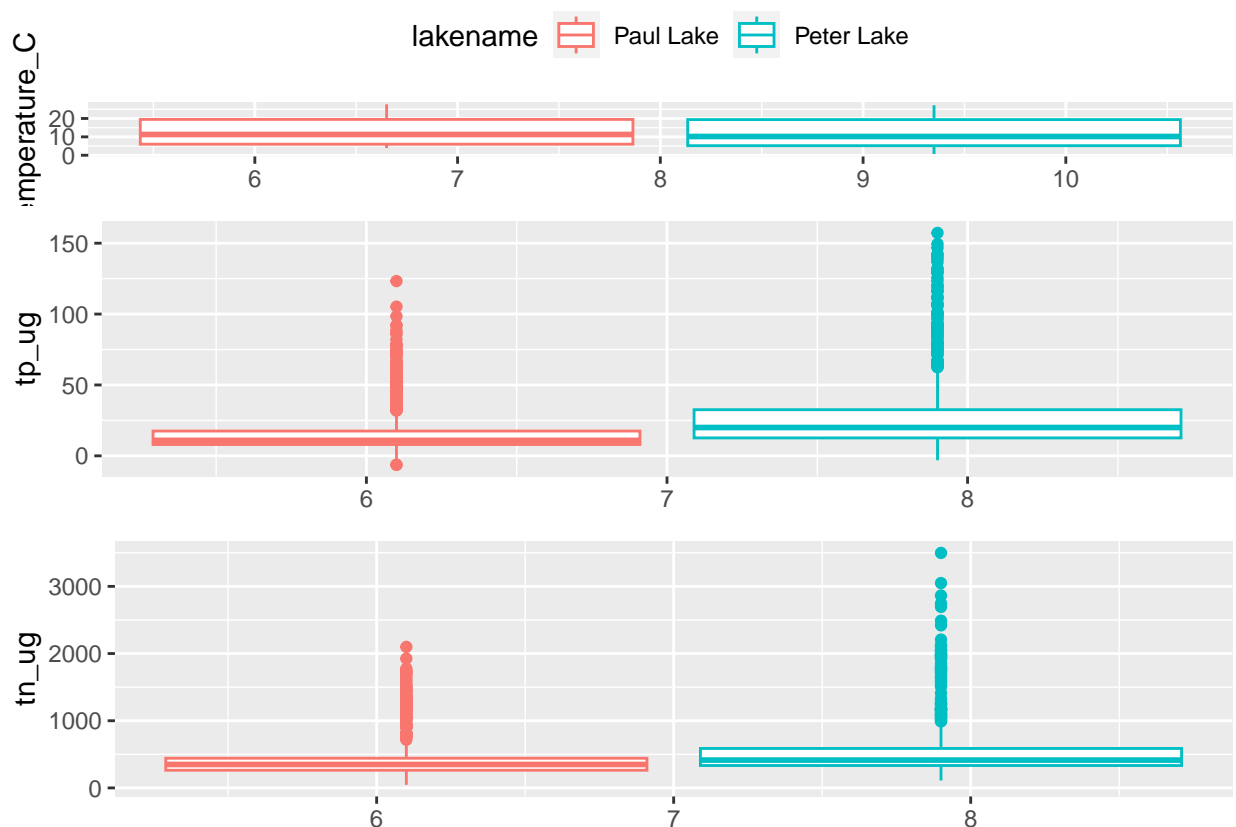

cplot <-
  ggplot(NTL, aes(x = month, y = tn_ug, color = lakename)) +
  geom_boxplot() +
  theme(axis.title.x = element_blank(),
        legend.position = "none")

allplot <- plot_grid(aplot, bplot, cplot, nrow = 3, align = 'h', rel_heights = c(0.7, 1, 1))

## Warning: Removed 3566 rows containing non-finite values (`stat_boxplot()`).
## Warning: Removed 20729 rows containing non-finite values (`stat_boxplot()`).
## Warning: Removed 21583 rows containing non-finite values (`stat_boxplot()`).
## Warning: Graphs cannot be horizontally aligned unless the axis parameter is
## set. Placing graphs unaligned.

print(allplot)

```

Question: What do you observe about the variables of interest over seasons and between lakes?

Answer: Peter Lake tends to have greater amount of nutrients than Paul Lake, and Peter Lake is more active in dates later than Paul Lake.

6. [Niwot Ridge] Plot a subset of the litter dataset by displaying only the “Needles” functional group. Plot

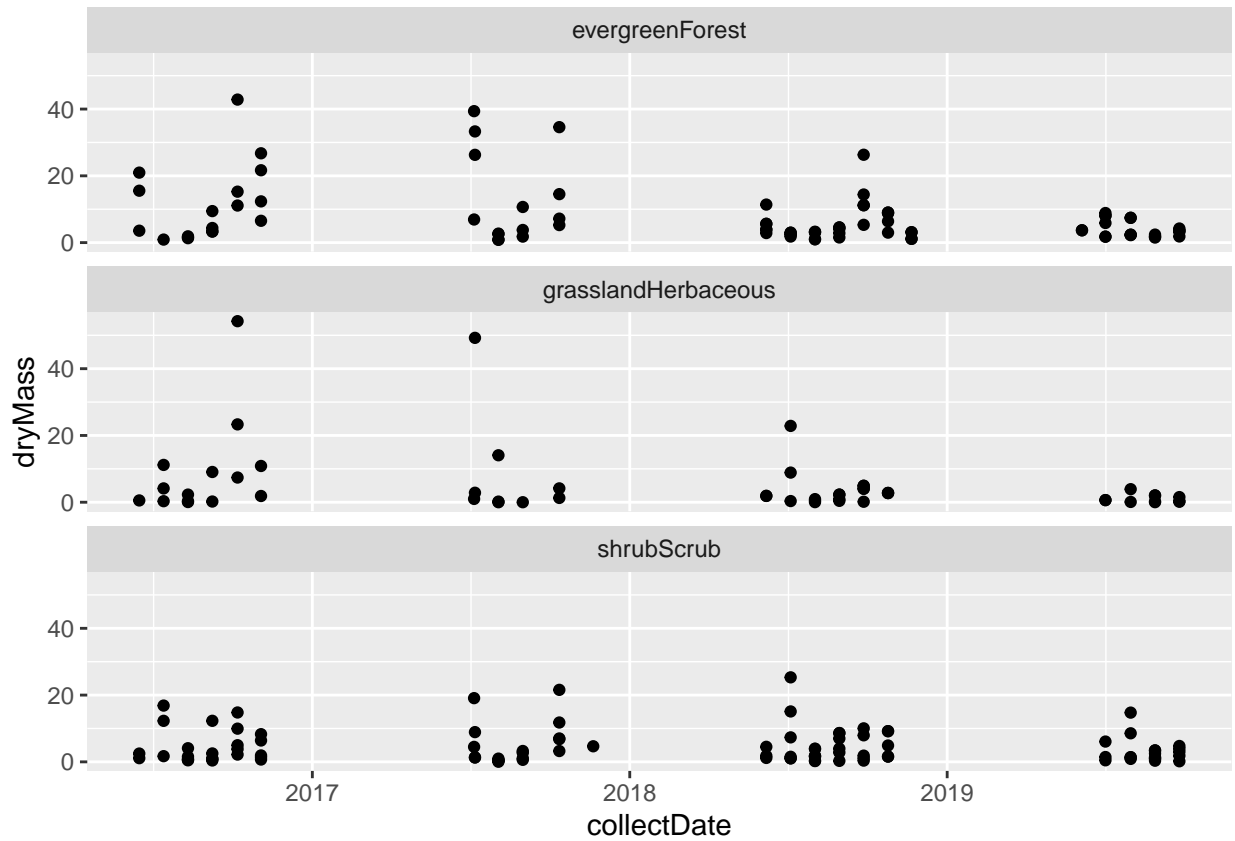

the dry mass of needle litter by date and separate by NLCD class with a color aesthetic. (no need to adjust the name of each land use)

7. [Niwot Ridge] Now, plot the same plot but with NLCD classes separated into three facets rather than separated by color.

```
#6
Niwot1 <-
  ggplot(subset(NIW0, functionalGroup == "Needles"),
    aes(x = collectDate, y = dryMass, color = nlcdClass)) +
  geom_point()
print(Niwot1)
```

```
#7
Niwot2 <-
  ggplot(subset(NIW0, functionalGroup == "Needles"),
    aes(x = collectDate, y = dryMass)) +
  geom_point() +
  facet_wrap(vars(nlcdClass), nrow = 3)
print(Niwot2)
```

Question: Which of these plots (6 vs. 7) do you think is more effective, and why?

Answer: I think plot 7 is more effective because it separates the data based on an additional layer. It shows the distribution by year and by nlcdClass whereas plot 6 crumples up all three nlcdClass together.
